

Problem 1.

Code a SELECT statement that shows the average advance, the total number books sold, and the number of books being published by Sunshine Publishers and All Techo Books.

NOTE: If more than one table is referenced in a SELECT statement, the tables must be properly joined. Any SELECT statement submitted with an incorrect join will lose a minimum of 1 point.

```
SELECT avg(advance), sum(ytd_sales) ,count(pubdate)
FROM publisher JOIN book USING(pub_id)
WHERE (name ='Sunshine Publishers' OR name = 'All Techo Books' ) ;
```

Problem 2.

Show all the editors in "Lastname, Firstname" format (e.g. "Perry, Steve") and display them in one column.

Make the column heading display "Editor Names" (quotes not included)

```
SELECT CONCAT( lastname ,', ' ,firstname) as 'Editor Names'
FROM editor;
```
