Problem 1.

Code a SELECT statement that shows all books and the authors who have written them, but only show this for the authors that are from California.

NOTE: If more than one table is referenced in a SELECT statement, the tables must be properly joined. Any SELECT statement submitted with an incorrect join will lose a minimum of 1 point.

```
SELECT title,firstname,lastname
FROM book
JOIN bookauthor USING(isbn)
JOIN author USING(author_id)
WHERE state = 'CA';
```

Problem 2.

Code a SELECT statement that will show the author's SSN for all authors who live in a city and state that is the same as where one of the publishers is based.

NOTE: If more than one table is referenced in a SELECT statement, the tables must be properly joined. Any SELECT statement submitted with an incorrect join will lose a minimum of 1 point.

```
SELECT ssn
FROM publisher p
JOIN author a
ON (p.state = a.state)
WHERE p.state = a.state AND p.city = a.city;
```
